

Deliverable 3: Social Media Analytics Report

Mirsha Jewelry | April 2026

Name	DM	Accountable	Reviewer
Arda Keleşoğlu		X	X
Özgür Akyol		X	X
Gizem Uluceviz		X	X
İrem Güldür	X	X	X
Zehra Betül Çelik		X	X

A. Introduction and Social Media Usage Status

Since Mirsha already uses Instagram and TikTok, this deliverable adapts the template by focusing not on why the organization avoids social media, but on how effectively its existing social media presence creates measurable business value.

Mirsha does actively use social media applications, primarily Instagram and TikTok, to promote its products and reach potential customers. However, these platforms are not used in a structured or data-driven manner. The content shared is mostly organic and product-focused, without a formal social media strategy that includes performance tracking, content planning, or conversion optimization. Social media activities are not systematically analyzed, and their impact on website traffic and sales remains unclear.

This creates a gap between what the company expects from social media and the actual outcomes achieved. The issue is therefore not the absence of social media usage, but the lack of strategic and analytics-driven implementation.

Platform Overview

 A screenshot of the Instagram profile for @mirsha.tr. The profile picture is a circular logo with the word 'MIRSHA' in the center. The bio reads: 'Discover the elegance within simplicity in every piece. Timeless elegance in flawlessly crafted 925 sterling silver and gold-plated brass designs. Çevirisine Bak www.mirsha.com.tr'. The statistics show 112 gönderi (posts), 2.820 takipçi (followers), and 1 arkadaş (friend). There are buttons for 'Takip Et', 'Mesaj', and 'E-posta'. At the bottom, there are story highlights for '#mirshagirls' and 'Mirsha x Inf'.	Platform: Instagram (@mirsha.tr) Followers: 2,820 Posts: 112 Website link: mirsha.com.tr Story highlights: #mirshagirls, Mirsha x Influencer Collaborations: Influencer/PR tagged Stories observed Sessions via ig: 719 / month, last 30 days (58.7% of total)

B. Stakeholder Expectations and Business Case

The decision makers of Mirsha expect social media platforms to play a key role in improving the company's digital performance. As a small boutique jewelry brand with limited marketing resources, social media is considered the primary channel for reaching and influencing potential customers. Based on the stakeholder interview conducted in Deliverable 1, the main expectations include:

- Increasing brand awareness among target customers
- Driving qualified traffic to the website
- Improving conversion rates by turning visitors into buyers

- Enhancing customer engagement and loyalty
- Understanding customer preferences and trends through interaction data

Key questions the organization aims to answer:

- Which types of content generate the highest engagement?
- How effectively do Instagram and TikTok drive traffic to the website?
- What percentage of social media visitors convert into customers?
- Which audience segments are most active and responsive?
- How does content frequency influence engagement and traffic?

Business Case	Key Questions
Lead Generation	Which platform and content type drives the most qualified sessions? Do Instagram Stories or feed posts generate more traffic?
Churn Reduction	Why do 97.7% of visitors never return? Can social channels recapture first-time visitors?
Customer Voice	Which product categories receive the most engagement? What do Instagram comments reveal about customer intent?
Key Influencer	Do collaborations produce measurable session or conversion lift? How can campaign impact be isolated and measured?
Brand Awareness	Can TikTok expand reach beyond the existing 2,820 Instagram followers? What content format performs best for new audience discovery?

C. Relevant Social Media Applications

The most relevant social media applications for addressing the key questions are Instagram and TikTok. These platforms complement each other strategically:

- Instagram focuses on engagement, traffic generation, and conversion. Posts, Reels, Stories, and link-in-bio tools make it suitable for both engagement and conversion-focused activities.
- TikTok focuses on awareness, discovery, and audience growth. Short-form video content allows the brand to reach new audiences and understand content preferences through performance data.

Both platforms provide built-in analytics tools (Instagram Insights and TikTok Analytics) directly relevant to answering the key business questions.

Platform	Relevance	Current Status
Instagram	Primary traffic source; Stories and feed posts drive 68.6% of website sessions; influencer/PR collaborations active	Active; 2,820 followers, 112 posts
TikTok	Discovery potential for visual product content; organic reach possible even with small follower base	Early stage; 23 followers, video views 279 to 8,225

Pinterest	Potentially relevant due to visual product discovery behavior in jewelry and fashion categories	Not currently active
Facebook	Present in GA4 social data; low priority	Minimal activity

D. Analytics Layers

Business Layer

The business layer focuses on turning social media activity into measurable business value. For Mirsha, the most relevant goals are brand awareness, qualified website traffic, influencer accountability, and customer retention. These goals are directly connected to the social media channels currently used by the brand.

Focus	Metric	Reasoning	Solution
Increase brand awareness and reach	Instagram Story reach; profile visits; TikTok video views and follower growth (via native platform analytics)	Public data suggests limited reach beyond the existing Instagram audience. TikTok is not yet developed as a discovery channel.	Post consistently on TikTok (3 to 4 videos per week) prioritizing model-focused content. Run Instagram collaborations to reach new audiences.
Drive qualified social traffic to the website	Instagram Story link clicks; bio link click-through rate; sessions by ig source in GA4	Instagram drives 68.6% of website sessions but all links point to the homepage, creating a mismatch between post content and landing page.	Update bio and Story links to point to the specific product shown in each post.
Measure influencer and PR collaboration impact	UTM-tagged sessions; sessions by utm_campaign in GA4; key events per campaign	Mirsha runs collaborations but no UTM parameters are used. A traffic spike was observed in March 2026 but cannot be attributed to any specific campaign.	Add UTM parameters to all influencer and campaign links before the next activation.
Improve social media retention	Returning user rate in GA4; newsletter sign-up conversion rate promoted via Stories	Since most first-time visitors arrive from Instagram, the retention problem is a social media problem. There is no mechanism to recapture first-time visitors via social channels.	Introduce a newsletter sign-up with a first-order incentive promoted through Stories.

Data Layer

Data sources used in this analysis, ordered by social media relevance:

- Instagram public profile: 2,820 followers, 112 posts, influencer/PR tagged Stories content.
- Instagram Reels view counts: 1,344 and 2,241 views (manually collected from two recent Reels).
- Instagram static post engagement: 15 to 25 likes per post (manually counted from recent posts).
- Instagram comments: 6 comments across 3 posts, manually collected and classified for sentiment and intent.
- Influencer/PR story evidence: tagged Stories content with #reklam, dedicated highlight category.
- TikTok public profile: 23 followers, 961 total likes, video views ranging from 279 to 8,225.
- TikTok static post: 38 likes, 0 comments, 5 saves (manually observed).
- Competitor benchmark: AJA Jewels Reels at 117,000 views; Guzzi Jewelry Reels at 764 views (manually collected).
- GA4 Social Value Report: confirms Instagram as the dominant social traffic source with 68.6% of all sessions.
- GA4 New vs. Returning: reveals that Instagram-acquired users have a 1.7% return rate despite 3x higher engagement when they do return.

Presentation Layer

- Manual content performance comparison table across Instagram and TikTok formats.
- Competitor benchmark table comparing Reels performance across similar brands.
- Sentiment and intent classification table from Instagram comments.
- GA4 Social Value Report and Acquisition reports for channel-level validation.
- Instagram and TikTok public profile screenshots.
- Instagram Business Insights (recommended; not shared by brand for this analysis).
- TikTok Analytics (recommended; profile-level data only accessible here).
- Google Looker Studio (recommended) for automated cross-channel dashboard.

Technology Layer

Tool	Layer	Cost	How it contributes to this analysis
Google Analytics 4	All	Free	Validates Instagram traffic share (68.6% of sessions) and reveals the social-to-website funnel behavior
Google Tag Manager	Data	Free	Recommended for UTM setup; would enable campaign-level attribution for influencer posts
Instagram Insights	Business/Presentation	Free	Would provide Story link clicks, reach, and audience demographics to complement the

			public profile data used here
TikTok Analytics	Business/Presentation	Free	Would provide watch time, traffic source, and follower growth data to extend the profile-level analysis
Google Search Console	Data	Free	Secondary; useful for separating organic search effects from social traffic to clarify Instagram's true contribution
Looker Studio	Presentation	Free	Recommended for combining GA4 and social data into an automated cross-channel dashboard
Linktree / Beacons / Lnk.Bio	Presentation	Free	Recommended for managing multiple product links in the Instagram bio; enables directing users to specific product pages without manually changing the bio URL

E. Analytics Results and Interpretations

E.1 Content Performance Analysis

The most significant social media finding is the performance gap between content formats. Data was manually collected from Mirsha's Instagram and TikTok posts to compare engagement by content type.

Content Type	Platform	Performance	Insight
Reels / Video (model-focused)	TikTok	7,479 to 8,225 views	Highest reach; model presence dramatically increases algorithmic distribution
Reels / Video (product-only)	TikTok	279 to 756 views	Significantly lower; product-only shots reach a fraction of the audience
Reels	Instagram	1,344 to 2,241 views	Strong reach relative to follower base; Stories link drives website clicks
Static photo	Instagram	15 to 25 likes	Very low reach; algorithm deprioritizes static posts
Static photo	TikTok	38 likes, 0 comments, 5 saves	Near-zero engagement; static content is not distributed on TikTok

Model-focused TikTok videos outperform product-only shots by 10 to 27 times. On Instagram, Reels achieve 60 to 140 times more reach than static posts. This directly answers the stakeholder question "which types of content generate the highest engagement?" and has immediate implications for content strategy.

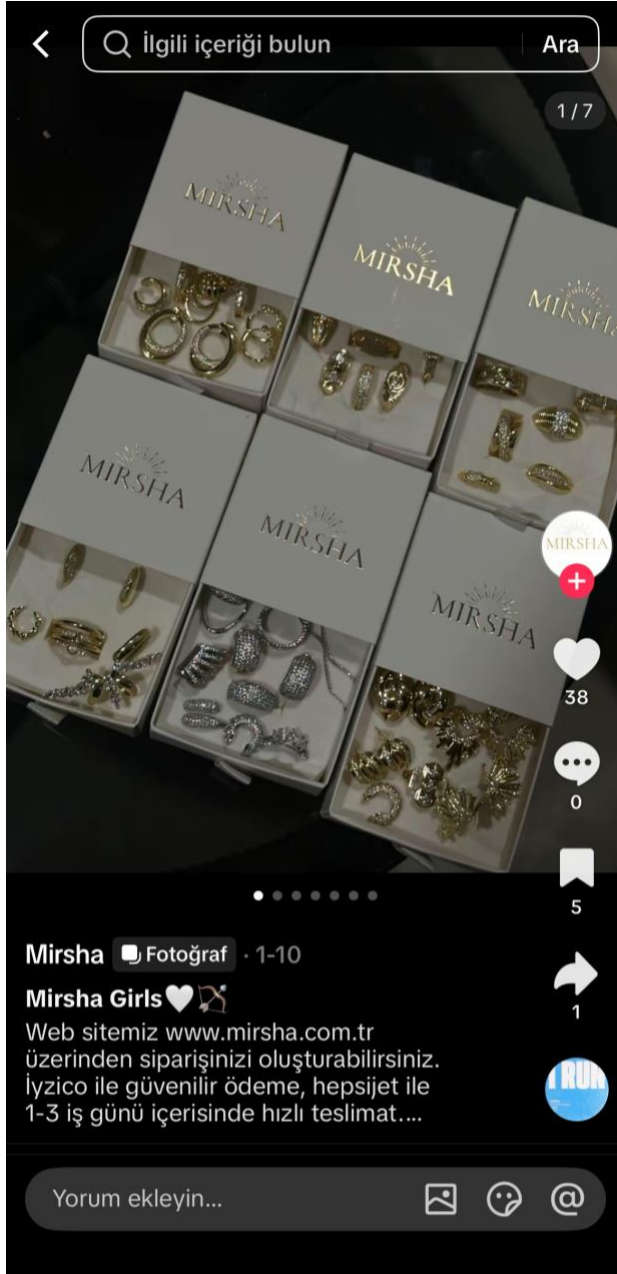

Figure E2. TikTok static post with 38 likes and 0 comments, illustrating poor static content performance | Source: Manual collection

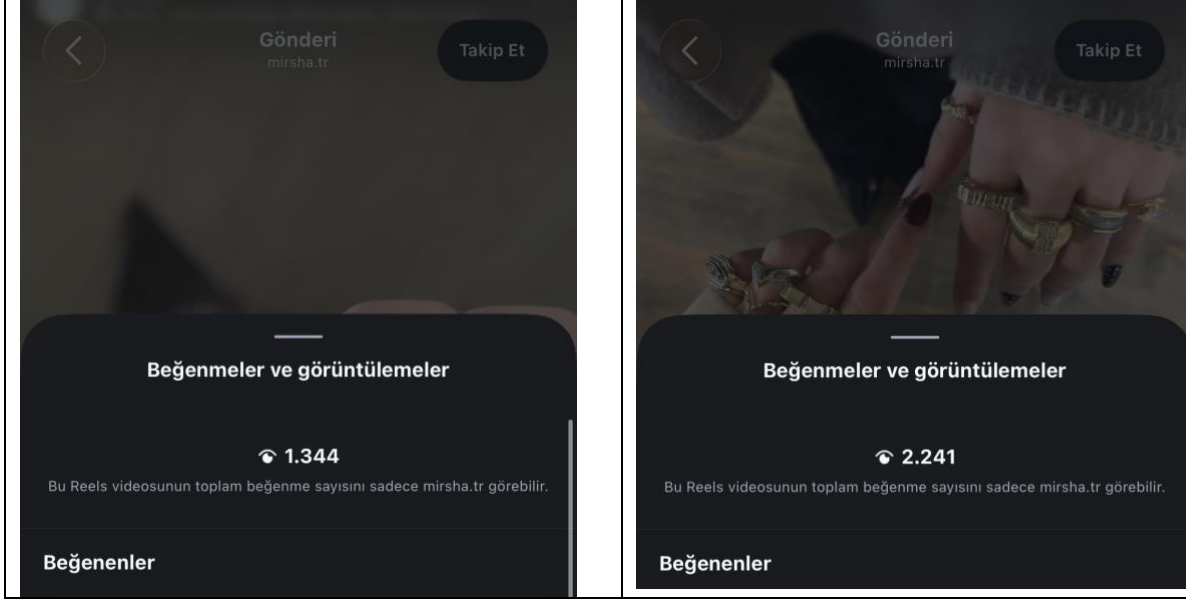

Figure E3. Instagram Reels view counts: 1,344 views (left) and 2,241 views (right) | Source: Manual collection

E.2 Competitor Benchmark

Two competitor brands were identified through Instagram's suggested accounts feature on the Mirsha profile: AJA Jewels (ajajewels.co) and Guzzi Jewelry (guzzi.jewelry). Both operate in the same Turkish jewelry market.

Brand	Reels Views (sample post)	Scale	Key Observation
AJA Jewels	117,000 views	Large / established	Verified account; significantly higher reach indicates stronger content strategy and/or paid amplification
Mirsha	1,344 to 2,241 views	Small / growing	Outperforms similarly sized competitors; content quality is competitive at this scale
Guzzi Jewelry	764 views	Small / similar	Mirsha outperforms Guzzi on Reels reach despite similar follower scale

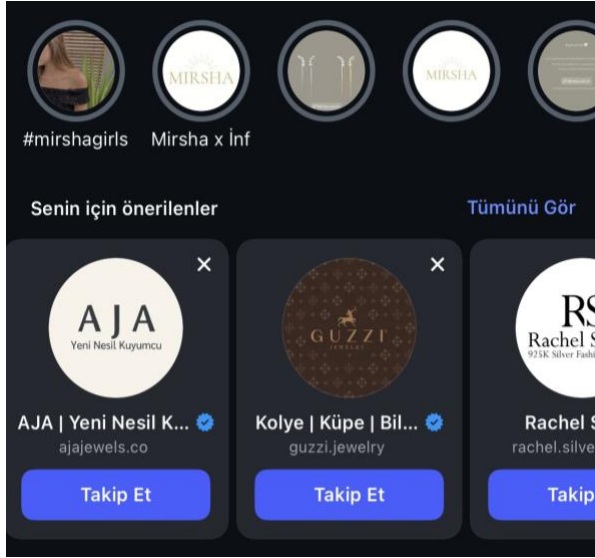

Figure E4. Instagram suggested accounts on Mirsha profile: AJA Jewels, Guzzi Jewelry, Rachel Silver | Source: Manual collection

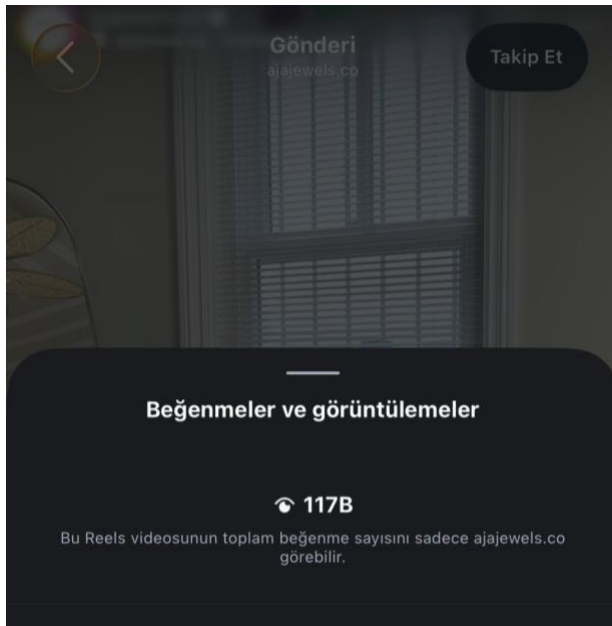

Figure E5. AJA Jewels Reels view count: 117,000 views | Source: Manual collection

Figure E6. Guzzi Jewelry Reels view count: 764 views | Source: Manual collection

E.3 Observations and Insights

Observation	Interpretation	Reasoning	Recommendation	Figure
Model-focused TikTok videos reach 7,479 to 8,225 views; product-only videos reach 279 to 756 views	Content featuring a model outperforms product-only shots by 10 to 27 times on TikTok.	TikTok's algorithm favors content with high watch time. Human presence increases emotional engagement and watch completion.	Prioritize model-focused Reels on TikTok. Reserve product-only shots for Instagram feed where aesthetic matters more.	Figure E1
Instagram Reels reach 1,344 to 2,241 views while static posts receive only 15 to 25 likes	Reels generate dramatically more reach than static posts on Instagram.	Instagram distributes Reels beyond the existing follower base. Static posts reach primarily current followers only.	Shift Instagram content strategy toward Reels. Use static posts only for brand aesthetic maintenance.	Figure E3
Mirsha Reels outperform Guzzi Jewelry (764 views) but are far below AJA Jewels (117,000 views)	Mirsha is competitive at its scale but has significant growth potential.	The gap between Mirsha and AJA likely reflects follower base size, posting frequency, and possibly paid	Study high-performing accounts like AJA Jewels. Increase Reels posting frequency to grow organic reach.	Figure E4, E5, E6

		amplification.		
Instagram drives 68.6% of website sessions; GA4 Social Value Report confirms Instagram Stories alone contribute nearly as many sessions as feed posts	Stories is a primary acquisition channel, not supplementary. The 719 monthly ig sessions shown in GA4 are directly tied to how often and how well Stories link to products.	The GA4 session data reflects the cumulative effect of Stories sharing frequency. More product-linked Stories would directly increase this number.	Every Stories post should include a product-specific link. Track Story link clicks via Instagram Insights to measure impact.	Figure E7, E8
Returning users are 1.7% of 30-day sessions but average 2 min 59 sec vs 59 sec for new users	Loyal visitors are significantly more engaged but Instagram alone cannot bring them back.	Since most new users arrive from Instagram and do not return, a social retention layer is needed to capture first-time visitors before they leave.	Promote newsletter sign-up through Stories with a first-order discount. Track returning user rate in GA4.	Figure E9, E10
83% of visible Instagram comments are price inquiries; 0% are negative	Users want to purchase but cannot find price information.	When potential buyers cannot find a price, some may abandon the journey rather than sending a DM.	Add pricing to posts, captions, and Stories. Ensure product pages display prices prominently.	Figure F1, F2, F3

Supporting GA4 Figures

The following two GA4 screenshots are included specifically to validate the social media traffic claims above. The Social Value Report confirms Instagram's dominance as a social traffic source, and the New vs. Returning report reveals the retention gap that social media channels must address.

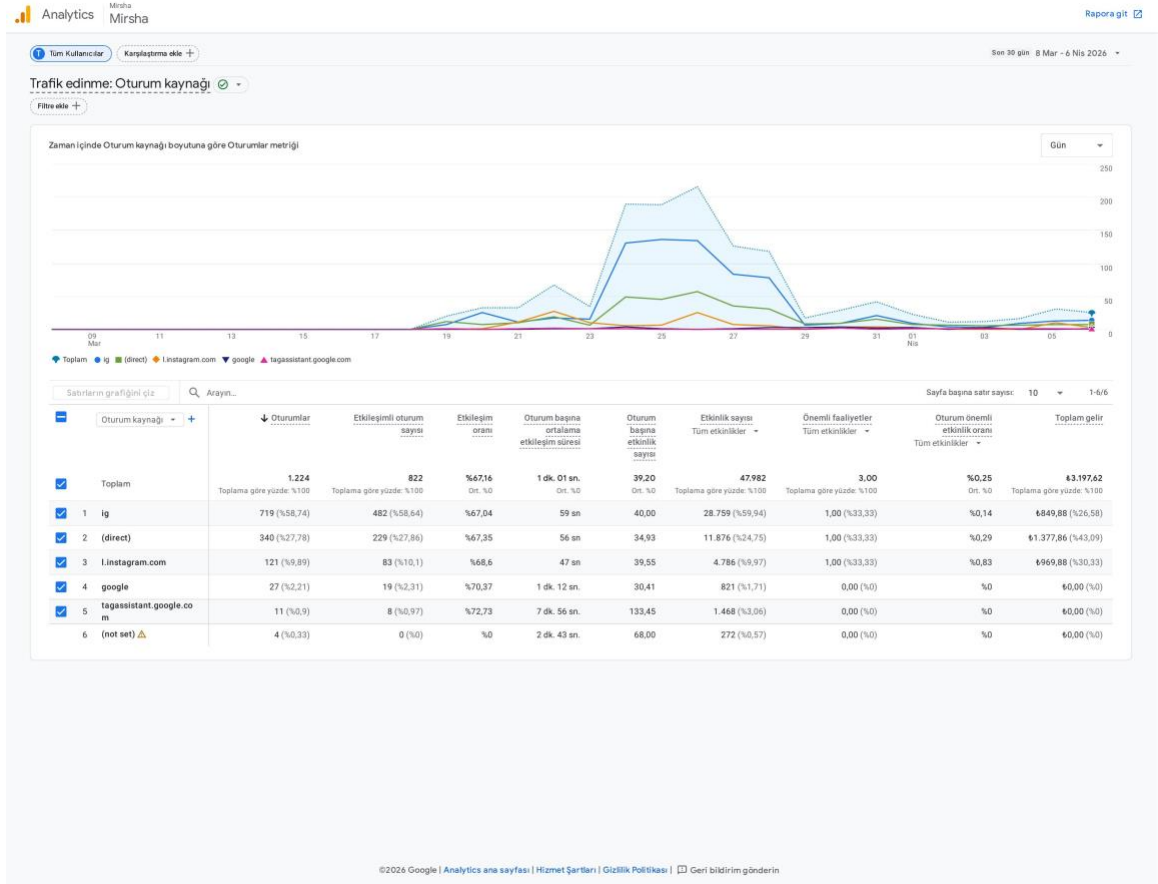

Figure E7. GA4 Social Value Report - Monthly. Instagram feed and Stories together account for over 94% of all social-driven sessions. | Source: Google Analytics 4

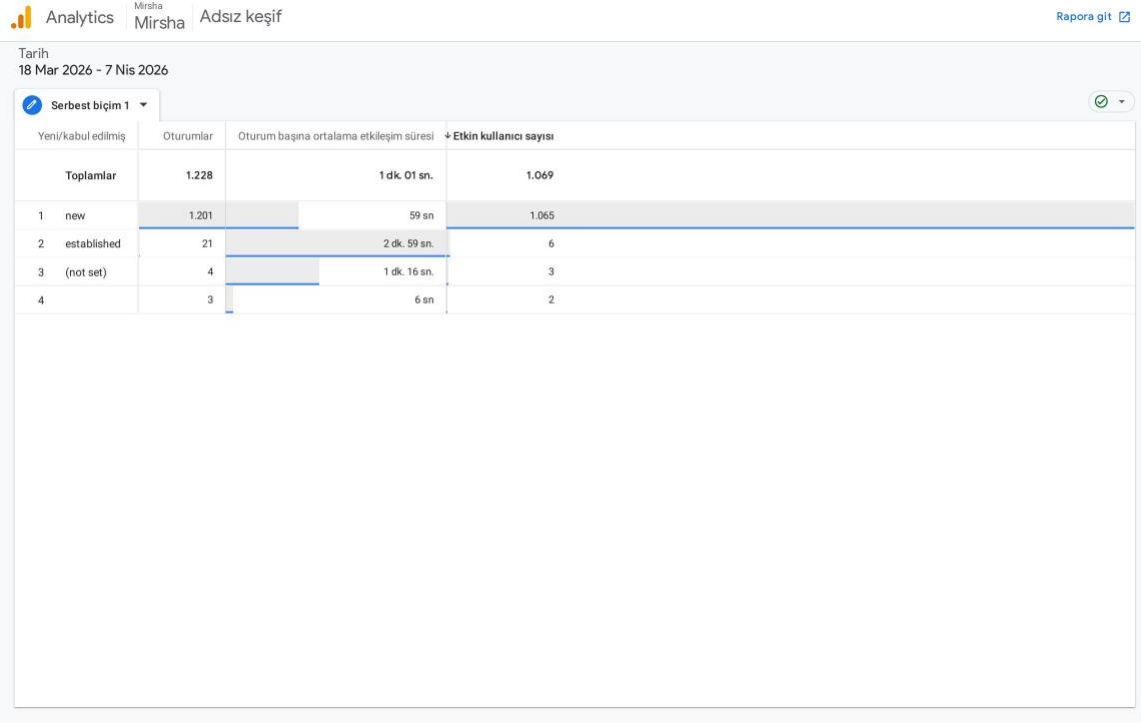

Figure E8. GA4 New vs. Returning Users - Monthly. 97.7% of sessions are new users; returning users show 3x longer engagement, confirming the value of retention via social channels. | Source: Google Analytics 4

Social-to-Website Conversion Signals

Out of 1,199 sessions in the 28-day window, 3 tracked purchases were recorded (0.25% conversion rate). The /checkout page records 13 sessions with the highest average engagement time (2 min 2 sec) and a key event rate of 7.69%, confirming that Instagram-driven users who reach checkout are motivated to purchase. The conversion bottleneck is not at the decision stage but at the landing page and pricing information stage, both of which are social media problems: the wrong landing page is caused by Instagram link choices, and missing pricing is a content decision.

Social Media Retention and Customer Loyalty

Returning users represent only 1.7% of 30-day sessions but average 2 minutes 59 seconds per session versus 59 seconds for new users. Since the overwhelming majority of new users arrive from Instagram, improving retention requires a social media layer. A newsletter promoted

through Stories is the most direct available intervention to capture first-time Instagram visitors before they leave permanently.

F. Sentiment and Intent Analysis of Instagram Comments

Because the sample includes only 6 visible comments, findings should be interpreted as directional insight rather than statistically representative sentiment.

Methodology

This analysis applies VADER (Valence Aware Dictionary and sEntiment Reasoner) as its methodological framework. VADER is a lexicon and rule-based sentiment analysis tool specifically designed for short-form social media content, making it appropriate for Instagram comment analysis. Due to the Turkish language limitation of fully automated VADER scoring, sentiment classification was applied manually following VADER's polarity logic conceptually rather than through automated scoring, because the comments were originally in Turkish and the dataset was very small. The translated comments were interpreted using VADER's positive, neutral, and negative categories. Each comment was additionally coded for purchase intent to capture the dominant behavioral signal in the data.

Comment Dataset

Comment (Original)	Translation	Sentiment	Intent
"slm fiyat nedir?"	"Hi, what is the price?"	Neutral	Purchase inquiry
"Yuzuk fiyatları nedir"	"What are the ring prices?"	Neutral	Purchase inquiry
"Yuzuklerin fiyatı nedir"	"What is the price of the rings?"	Neutral	Purchase inquiry
"İkinci takım ne kadar acaba"	"I wonder how much the second set is"	Neutral	Purchase inquiry
"Fiyatı nedir"	"What is the price?"	Neutral	Purchase inquiry
"Yuzugun güzelliği şaka mı"	"The beauty of this ring, is it a joke?" (admiration)	Positive	Product admiration

Sentiment and Intent Distribution

Category	Count	%	Interpretation
Neutral / Purchase inquiry	5	83%	Users are motivated to purchase but cannot find price information
Positive / Product admiration	1	17%	Product aesthetics are appreciated; no negative reactions observed
Negative	0	0%	No complaints or quality issues raised in this sample

Comment Screenshots

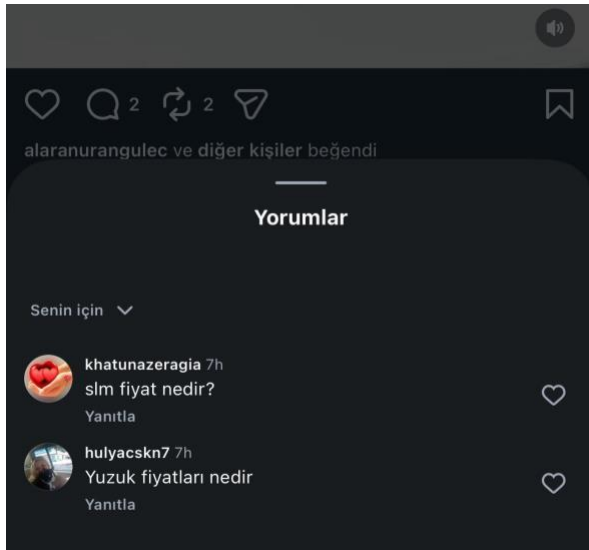

Figure F1. Instagram comments - Post 1 | Source: Manual collection

Figure F2. Instagram comments - Post 2 | Source: Manual collection

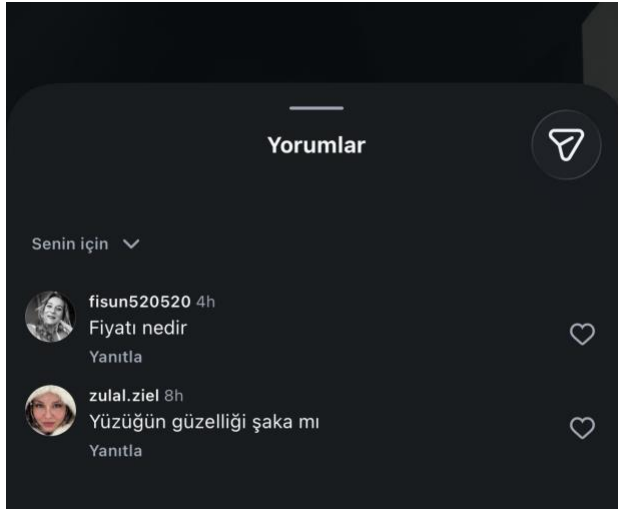

Figure F3. Instagram comments - Post 3 | Source: Manual collection

Key Insight

Within the visible comment sample, most engagement appears to be purchase-oriented rather than purely social. The dominant comment type is a price inquiry, meaning users are arriving at the content, showing clear purchase intent, and leaving without converting because price information is not visible. Adding prices to captions or Stories would directly address the most common audience response without requiring any new content creation.

The absence of negative comments in this small sample suggests that visible audience reaction is not focused on dissatisfaction; however, the sample is too small to make broad claims about overall sentiment or product quality.

The content performance data adds important context: as Mirsha shifts toward Reels, which reach 60 to 140 times more users than static posts, the volume of price inquiries will likely increase proportionally. Solving the pricing transparency issue now, before reach scales up, will have compounding returns.

G. Hypotheses for Improvement

H1: Shifting to model-focused Reels on TikTok will significantly increase video reach.

Data basis: model-focused TikTok videos reach 7,479 to 8,225 views versus 279 to 756 for product-only shots, a difference of 10 to 27 times.

Target: achieve average TikTok video views above 1,000 within 60 days of implementing model-focused content consistently.

Metric: average views per video in TikTok Analytics; follower growth rate.

H2: Adding price information to posts and captions will reduce price-inquiry comments and increase product-page clicks.

Data basis: 83% of all visible Instagram comments are price inquiries.

Target: reduce price-inquiry comment share from 83% to below 40% and increase product-page clicks from Instagram within 30 days.

Metric: comment intent distribution (manual review); product page sessions from ig source in GA4; clicks from link-in-bio tool (e.g. Linktree, Beacons, or Lnk.Bio) if used; DM volume if available.

H3: Linking posts and Stories to product-specific pages will reduce the homepage landing mismatch.

Data basis: 68.6% of sessions land on the homepage regardless of which product was shown in the post.

Target: reduce homepage-only entry sessions from 68.6% to below 50% within 60 days.

Metric: landing page breakdown in GA4 Acquisition report.

H4: UTM parameters on all campaign links will enable accurate ROI measurement for influencer collaborations.

Data basis: a traffic spike in March 2026 is visible in GA4 but cannot be attributed to any specific campaign.

Target: 100% of future influencer and campaign links carry UTM parameters from the next campaign onward.

Metric: sessions by utm_campaign dimension in GA4 Acquisition report.

H5: A newsletter sign-up promoted through Instagram Stories will improve returning visitor rate.

Data basis: returning users are only 1.7% of monthly sessions but show 3x longer engagement. The majority of new users arrive via Instagram.

Target: returning visitor share from 1.7% to 5% within 90 days of newsletter launch.

Metric: established users percentage in GA4 new vs. returning report.

Priority Matrix

Action	Impact	Effort	Priority
Add price information to Instagram posts and captions	HIGH	LOW	Do First
Shift TikTok content to model-focused Reels	HIGH	LOW	Do First
Update Stories and bio links to product-specific pages	HIGH	LOW	Do First
Add UTM parameters to all influencer and campaign links	HIGH	LOW	Do First
Increase TikTok posting frequency to 3 to 4 per week	MEDIUM	LOW	Do First
Newsletter sign-up promoted via Instagram Stories	HIGH	MEDIUM	Plan Next
TikTok hashtag and community engagement strategy	MEDIUM	LOW	Plan Next
Connect Google Search Console	MEDIUM	LOW	Plan Next
Pinterest channel activation	MEDIUM	HIGH	Longer Term

H. Risks and Limitations

- No UTM tracking on social and influencer links: campaign-driven sessions cannot be separated from organic social in GA4.
- Instagram Insights not shared: post reach, Story completion rates, and audience demographics were not available. Analysis relies on GA4 data and manually collected public profile data.
- TikTok Analytics not accessible: only public profile-level view counts were used. Average watch time, traffic source, and follower acquisition data were not available.
- Small comment sample: only 6 comments were available for sentiment and intent analysis. Findings are directional rather than statistically representative. To expand the dataset in future cycles, methods such as Instagram giveaways, Story polls, or comment prompts in captions could generate a higher volume of responses for more robust classification.
- Content performance data is manually observed: view counts and engagement figures were collected manually and may not reflect the full post history.
- Competitor benchmark is limited: only one post per competitor was observed. A reliable benchmark would require multiple posts over time.
- Safari ITP limitations: iOS Safari may suppress some GA4 event tracking, meaning conversion events may be undercounted.
- Short data window: the 28-day GA4 window may not reflect seasonal patterns significant for a jewelry brand.

I. Preliminary Company Feedback

The following points summarize preliminary feedback collected from the brand representative during the review process.

Finding Presented	Company Response
68.6% of sessions land on the homepage due to Instagram links not pointing to product pages	The team acknowledged this was not intentional and confirmed they had not previously tracked where Instagram traffic was landing. They agreed to update Story links going forward.
83% of Instagram comments are price inquiries with no visible response	The representative noted that pricing is intentionally kept off posts to encourage DMs. They are open to reconsidering this based on the data.
TikTok account is present but not actively managed	Confirmed that TikTok was opened as a test but has not been prioritized due to limited team capacity. No formal content plan exists for the channel. It was also noted that adding a UTM-tagged website link to the TikTok bio would allow GA4 to attribute website visits originating from TikTok for the first time.
No UTM parameters on influencer collaboration links	The team was not aware of UTM tracking as a practice and expressed interest in implementing it for future campaigns.
Model-focused videos significantly outperform product-only shots on TikTok	The team found this insight actionable and noted they had not previously analyzed performance by content type. They expressed interest in testing this approach.

The feedback confirmed several key gaps identified in this analysis. The most actionable items require minimal technical effort and were received positively.
